FAQ

Can I scan fluids and medications on infusion pumps through GuidedOR?
No. Only bolus medications should be scanned through GuidedOR. Fluids and medications on infusion pumps will continue to be documented directly in Epic.

How do I document boluses that are given over a certain length of time (e.g., 10min)?
Scan and document the medication dose in GuidedOR. Then click on the administration in Epic to add the “given over” time.

What happens if the barcode scanner doesn’t work or I cannot scan a medication?
With GuidedOR, you can either scan a medication with a barcode or manually select it from the GuidedOR dropdown menu.

Can I turn off the read-back functionality?
Yes. You can adjust the read-back volume via the native monitor speakers in the bottom right corner of your screen. We recommend you keep the auditory readback alongside the visual display of the medication name to help you recognize when an unintended medication is scanned.

Can I adjust the time in the dosing window?
Yes. The dosing window timestamp defaults to the time the medication was scanned, but you can adjust the time depending on when the medication was administered.

Can I enter a different dose than the available dose options or the recommended default dose?
Yes. You can enter a new dose in the free text box.

Can I continue working in the EHR while GuidedOR is open?
Yes, simply minimize the GuidedOR window to continue working in the EHR. The GuidedOR window will automatically come back in focus upon scanning a medication and automatically minimize once all dosing windows have been saved.

Can I disable specific alerts or reminders?

Yes. You can disable allergy alerts by clicking on Settings (“gear” icon) next to the patient MRN.

Can I use GuidedOR for a pediatric patient?

No. GuidedOR algorithms currently support adult patients only. Development of a pediatric module is in progress. Until then, as a safety feature, GuidedOR will not launch for pediatric patients.
